This functional dashboard for a financial portfolio offers a view of user's financial data, integrating both frontend and backend.

**Virtual credit card display** includes info on card number, user name, expiration date

**Cash flow overview** summarizes monthly income, expenses, and net balance

**Expense Breakdown** gives a pie chart, showing expense divisions

**Investment insights** highlight monthly and yearly investments in a chart

**Feature called Insight of the day** provides spending alerts and untypical spending patterns

The dashboard is styled for easy interpretation,  
with data fetched dynamically from the backend.

Data is being collected, then it is being analysed by data analysis. Based on the analysis, we can say which goods/services exceeded average expenses, so this money could be reinvested.

This platform helps to control finance and  
analyse expenses.
